INTRODUCTION

- Prototype Model is an SDLC approach.
- A working model is developed before the final product.
- User feedback is collected.
- Product is refined until customer satisfaction.

WHAT IS PROTOTYPE MODEL?

A Prototype is an early version of software created to understand customer requirements before full-scale development.

WHY USE PROTOTYPE MODEL?

- Requirements are unclear.
- Continuous customer involvement.
- Early detection of errors.
- Improves user satisfaction.

PROTOTYPE SDLC PROCESS

PHASE 1: REQUIREMENT GATHERING

- Gather initial requirements.
- Understand customer expectations.
- Identify major functionalities.

PHASE 2: QUICK DESIGN & PROTOTYPE

- Prepare basic design.
- Develop working prototype.
- Focus on user interface and major features.

PHASE 3: CUSTOMER EVALUATION

- Customer tests the prototype.
- Feedback is collected.
- Missing features are identified.

PHASE 4: REFINEMENT

- Modify prototype.
- Improve design.
- Repeat until approval.

ADVANTAGES

- Better understanding of requirements.
- Early user feedback.
- Reduced development risk.
- Higher customer satisfaction.
- Fewer defects.

DISADVANTAGES

- Increased development cost.
- Frequent changes.
- Time consuming.
- Poor documentation.
- Scope creep.

APPLICATIONS

- Banking Systems
- Mobile Applications
- E-commerce Websites
- Healthcare Software
- Educational Portals

REAL-LIFE EXAMPLE
